

ABSTRACT OF THE DISCLOSURE

Rigidity distribution of trunk floor is uneven, and intervals between high rigidity portions and low rigidity portions are set uneven, and more specifically a plurality of concave commodity storage spaces are integrally formed in the trunk floor, and dimensions of the these storage spaces and/or walls formed among storage spaces are set differently from each other, so that the rigidity of the trunk floor is set uneven. Thereby, in using resin materials for a floor panel, vibrations in the floor can be suppressed by a relatively simple structure without increasing the weight.
